Garmin Workout Organizer

User guide

Version 3.0 — from a photo or a text to your watch: Garmin, Coros, Suunto, Amazfit or Huawei

1. What the extension does

Garmin Workout Organizer reads a workout — a photo, a screenshot, copied text or a Garmin JSON file — and asks an AI (Gemini or Claude) to understand every step: warm-up, intervals, recoveries, paces, distances and durations. It then creates the workout either in Garmin Connect or in your intervals.icu calendar. From there, the workout reaches your watch.

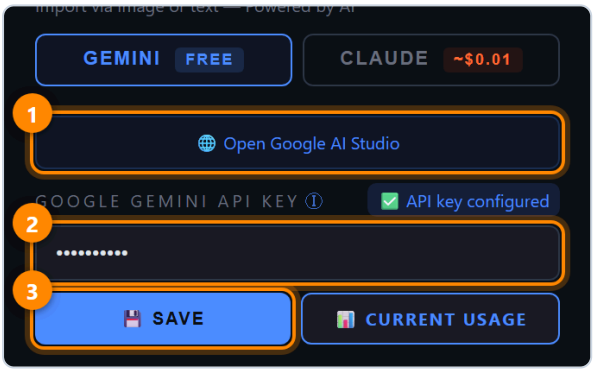

2. Quick start

1. Create a free Gemini API key at aistudio.google.com/api-keys.

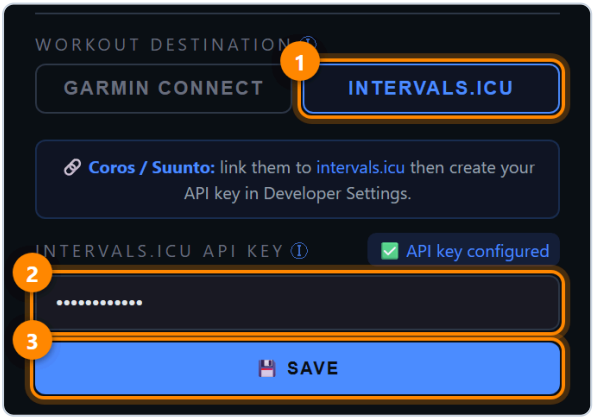

aistudio.google.com/api-keys

2. Click the extension icon, paste the key under **Google Gemini API Key** and click **Save**.

① **Open Google AI Studio** · ② **Google Gemini API Key** · ③ **Save**

3. Under **Workout destination**, choose Garmin Connect or intervals.icu.

① intervals.icu · ② **intervals.icu API key** · ③ **Save**

4. Garmin Connect: open your Workouts page, copy a plan and click GarminWorkOut. intervals.icu: right-click an image or selected text → **Send to intervals.icu**.
5. Check the workout, then sync your watch (sections 4 and 5).

3. One-time setup

AI key (one is enough)

Gemini is free (about 20 requests per day per model): create the key at aistudio.google.com/api-keys, it starts with "AIza". Claude costs about $0.01 per analysis: create the key in console.anthropic.com, it starts with "sk-ant-"; new accounts may get free credit. Switch between the two at any time with the Gemini / Claude tabs.

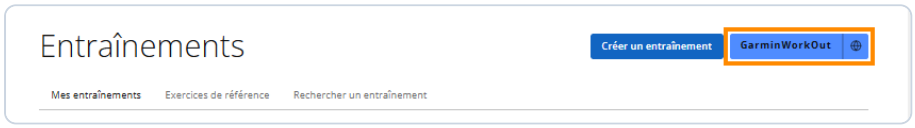

Destination

Choose where workouts are sent: Garmin Connect (default) or intervals.icu. You can change it whenever you want; the right-click menu title follows your choice.

4. Send a workout to a Garmin watch (Garmin Connect)

For Garmin watches. The extension creates the workout in your Garmin Connect account; the Garmin Connect app then sends it to the watch.

1. In the extension, set **Workout destination** to Garmin Connect.
2. Sign in to connect.garmin.com and open Training → Workouts (connect.garmin.com/app/workouts). A GarminWorkOut button appears next to "Create a workout".

connect.garmin.com/app/workouts

3. Get your workout: copy the text of the plan, or copy a photo or screenshot (right-click the image → Copy image).
4. Click GarminWorkOut. The clipboard is read automatically (your browser may ask you to allow it once). Copied text is analysed straight away. A copied image appears in the window: click **Analyse session**. If the clipboard is empty, a file picker opens (image, JSON or text); you can also drop a file into the window.

GarminWorkOut

5. Wait a few seconds while the AI reads the workout.

6. If several sessions are found, tick the one to import. Each card lists the steps; a mark appears when a date was found.
7. Click **Import into Garmin Connect**. If a date was found, **Import and add to calendar** also schedules the workout on that day (see the **Add to calendar (dated workout)** setting).
8. The page reloads and shows your new workout. Open the Garmin Connect app on your phone (or Garmin Express) and synchronise your watch.
9. On the watch, open Training → Workouts (the menu name varies by model). A scheduled workout also appears in the calendar of its day.

> **Tip** A Garmin Connect JSON export can be dropped into the window: it is imported without any AI call.

> **Tip** You can also right-click an image or selected text on any web page → **Send to GarminWO**: a Garmin Connect tab opens with your content already loaded.

5. Send a workout to a Coros, Suunto, Amazfit or Huawei watch (intervals.icu)

For Coros, Suunto, Amazfit (Zepp) and Huawei Health watches. The extension creates the workout in your intervals.icu calendar; intervals.icu forwards planned workouts to the accounts you linked. You need a free intervals.icu account.

A. One-time setup on intervals.icu

1. Go to intervals.icu → Settings → Connections and link your watch brand's account (Coros, Suunto, Amazfit, Huawei Health).

intervals.icu/settings/connections

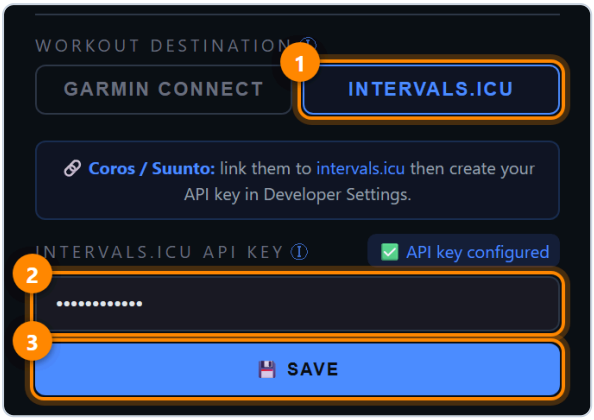

2. On that brand's card, tick "Send planned workouts from Intervals".
3. Go to Settings → Developer Settings, create an API key and copy it.

intervals.icu/settings

B. In the extension

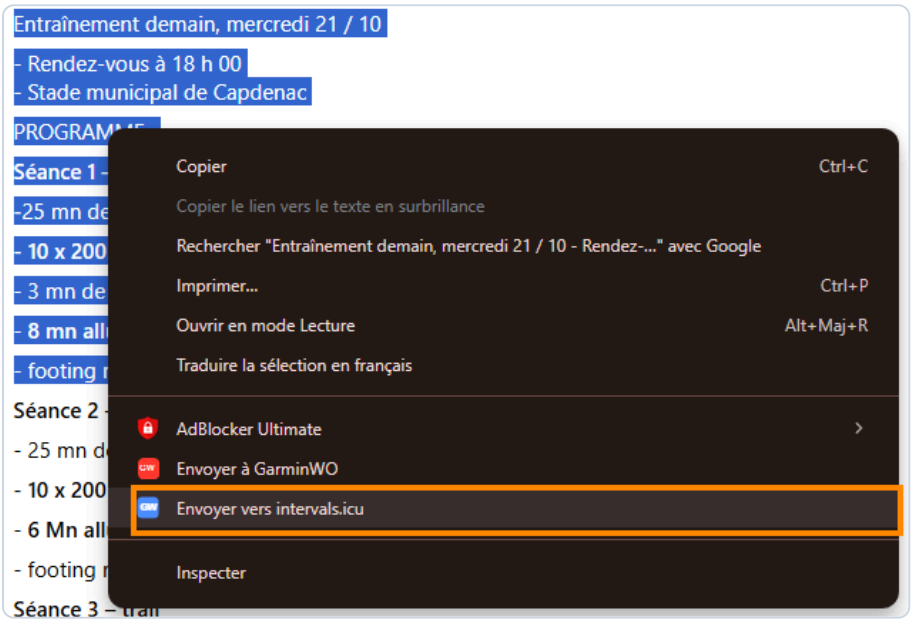

1. Under **Workout destination**, choose intervals.icu. A field **intervals.icu API key** appears: paste the key and click **Save**. The tag **API key configured** confirms it.

① intervals.icu · ② **intervals.icu API key** · ③ **Save**

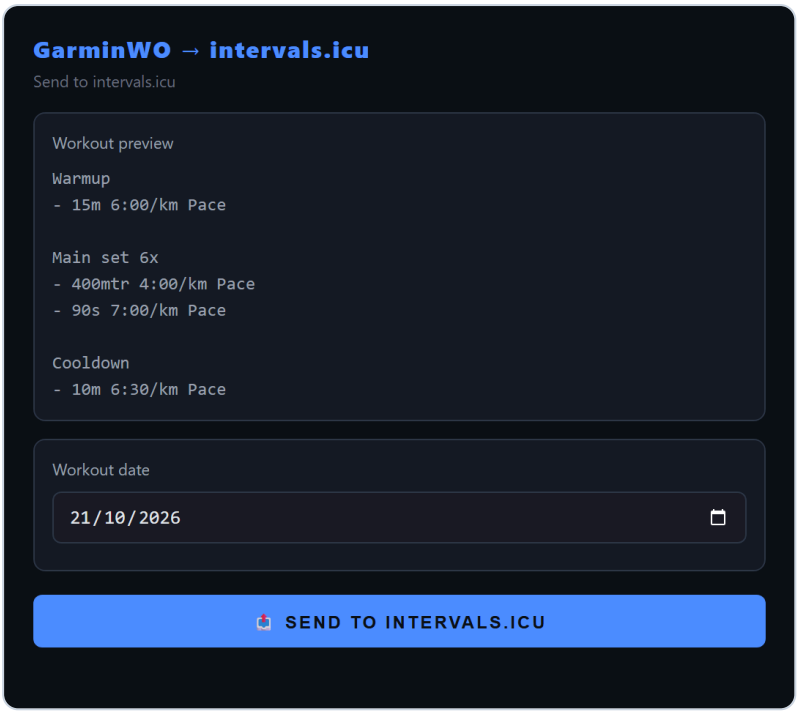

C. Send a workout

1. On any web page, right-click an image or select some text, then choose **Send to intervals.icu**.

Send to intervals.icu

2. A small window opens and the AI analyses the workout (a few seconds).
3. If several sessions are found, choose one. The preview shows the workout converted to the intervals.icu format.
4. Check the date. It depends on the **Add to calendar (dated workout)** setting: **Ask** — a date picker pre-filled with the detected date (or today); **Always** — the detected date, or a date picker if none was found; **Never** — today. When nothing has to be decided, the workout is sent automatically.
5. Click **Send to intervals.icu**. The workout is created in your intervals.icu calendar (as a run) and the calendar opens.
6. intervals.icu forwards it to the linked brand. Open the brand's app (Coros, Suunto, Zepp, Huawei Health) and sync your watch.

The send window: preview, date and send.

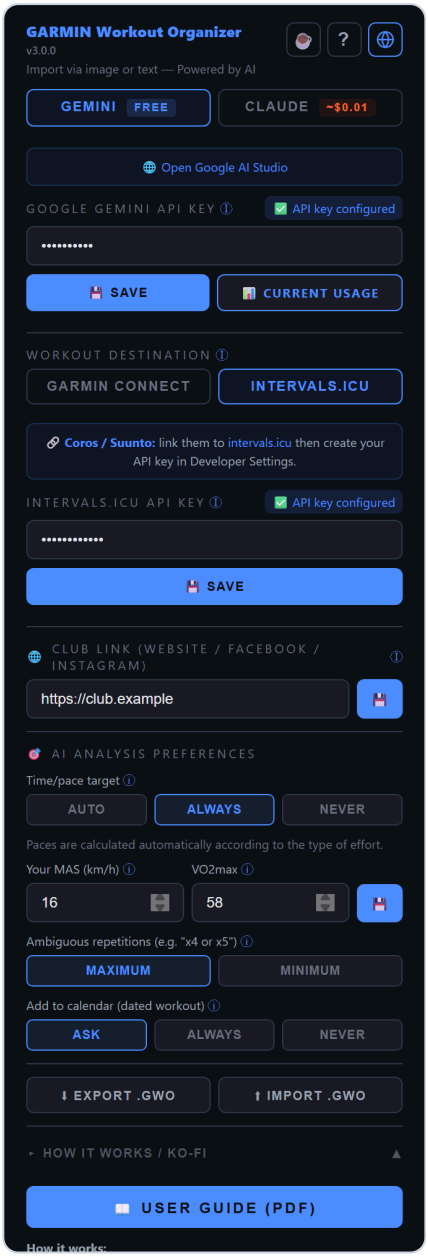

> **Note** Delivery to the watch depends on intervals.icu and on your brand. Check the workout on your watch before relying on it.

> **Note** If you have not set your thresholds in intervals.icu, its zone colours may look odd, but the paces you see are the ones from your workout.

> **Note** With Garmin Connect, the workout can take a few minutes to show up in the calendar (refresh the page or sync your watch). It cannot be edited in Garmin Connect: fix it in intervals.icu and it will be sent again.

6. The menu, field by field

☕	Opens the Ko-fi page to support the project.
?	Opens this guide (PDF) in your browser's language; in English if your language is not available. The same button also appears at the top of the “How it works” section.
🌐	Opens your club link. It is highlighted once a link is saved; with no link, it takes you to the **Club link (website / Facebook / Instagram)** field.
Gemini / Claude	Choose the AI that analyses your workouts. Gemini has a free tier (**FREE** badge); Claude costs about $0.01 per analysis.
Open Google AI Studio	Opens the page where you create your Gemini key (aistudio.google.com/api-keys). With Claude, the link opens the Anthropic console.
Google Gemini API Key / **Anthropic API Key**	Paste your key (Gemini: "AIza…", Claude: "sk-ant-…"). It is stored only in your browser. **API key configured** confirms it is saved.
Save / **Current usage**	The first stores the key. The second opens the usage or billing page of the selected provider.
Workout destination	Garmin Connect or intervals.icu. Choosing intervals.icu shows the intervals.icu key field and a reminder to link Coros / Suunto in intervals.icu.
intervals.icu API key	Personal key created in intervals.icu → Settings → Developer Settings. Stored only in your browser and sent only to intervals.icu.
Club link (website / Facebook / Instagram)	Website, Facebook or Instagram page of your club. The 💾 button saves it; both 🌐 buttons (menu and Garmin Connect toolbar) open it in one click.
Time/pace target	**Auto** — a pace is imported only if it is written in the workout (nothing is invented). **Always** — every step gets a pace: written paces are kept, the others are proposed by the AI; if you enter your MAS, all paces are recalculated from the type of effort (warm-up ≈ 65 %, recovery ≈ 55 %, intervals by duration). **Never** — no pace is imported, steps keep their duration or distance.
MAS / VO2max	Shown only in **Always** mode. MAS: 8.3 to 27.8 km/h. VO2max: whole number from 30 to 100. They are linked (MAS = VO2max ÷ 3.6): fill one and the other follows. To find your MAS: VAMEVAL / Léger-Boucher test, a 6-minute test (distance in metres ÷ 100), or your coach. Click 💾 to save.

The extension menu (click the icon in the toolbar).

Ambiguous repetitions (e.g. "x4 or x5")	When a plan says "4 or 5 times": Maximum uses 5, Minimum uses 4.
Add to calendar (dated workout)	Used when the workout has a date. Garmin Connect — Ask: a second button Import and add to calendar appears; Always: the normal import also schedules it; Never: nothing is scheduled. intervals.icu — Ask: date picker pre-filled; Always: detected date (picker if none); Never: today.
Export .gwo / Import .gwo	Saves or restores all your settings (keys, engine, destination, club link, preferences, MAS) in an encrypted file. Keep it private: it contains your keys.
How it works / Ko-fi	A short guide and the donation link.

7. On the Garmin Connect page and with a right-click

GarminWorkOut	On the Garmin Connect Workouts page, next to "Create a workout". Opens the import window (clipboard, photo, text or JSON).
🌐	Next to the button: opens your club link.
☑	Checkboxes in the workout list: tick several workouts, a bar at the bottom shows the count with Cancel and Delete. Deletion is permanent and asks for confirmation. Garmin Connect only.
Right-click	On an image or selected text: Send to GarminWO (destination Garmin Connect) or Send to intervals.icu (destination intervals.icu). The menu title follows your choice.

8. Troubleshooting

Configure your API key	Open the menu, paste your key under the selected engine and click Save.
Free Gemini quota exhausted	Gemini allows about 20 requests per day per model. Wait for the reset, enable Google billing, or switch to Claude (Retry with Claude).
Invalid response	Try again, switch engine, or use a sharper image or paste the text instead.
intervals.icu key rejected (401 / 403)	Create a new key in Settings → Developer Settings, paste it without spaces and click Save.
The workout is not on my watch	In intervals.icu check that the brand is linked, that "Send planned workouts from Intervals" is ticked and that the date is right. Then sync the brand's app (or the Garmin Connect app).
No date detected	Write the date in the text (for example "Wednesday 21/10"), or pick it yourself in the date picker.
Missing or odd paces	Set Time/pace target (Auto / Always / Never) and enter your MAS for calculated paces.
GarminWO has been updated — reload the page	Press F5 on the Garmin Connect tab.
Nothing happens when I click	After installing or updating the extension, reload the Garmin Connect page (F5).

9. Privacy and legal

- No server of ours is involved. API keys stay in your browser. Images and text go directly to the AI you chose (Google for Gemini, Anthropic for Claude); the workout goes only to the platform you chose (Garmin Connect or intervals.icu).
- Unofficial extension, not affiliated with Garmin Ltd., Coros, Suunto, Amazfit, Huawei or intervals.icu. All trademarks belong to their respective owners.
- Free extension — donations on Ko-fi help keep it maintained and fund test equipment.
